Akshaya Vangalapudi -2420090047

AI-Powered Adaptive Disaster Management and Intelligent Evacuation Route Recommendation System

Abstract:

Disaster situations require quick and reliable decisions to ensure public safety. The AI-Powered Adaptive Disaster Management and Intelligent Evacuation Route Recommendation System uses artificial intelligence to analyze disaster conditions, identify potential hazards, and recommend safer evacuation routes. The system dynamically adapts its recommendations based on changing conditions such as blocked routes, crowd density, and hazard locations. It aims to assist authorities and individuals in making faster evacuation decisions, reducing risks, and improving disaster response efficiency. The project demonstrates the application of AI and Adaptive Software Engineering principles in developing a responsive and intelligent emergency management solution.
